

Some guy this Arduino IDE's editing interface is no so friendly, non-standard indentation, no syntax highlighting, no Autocomplete and so on. In short, if you've used other excellent editor such as emacs, vim, even notepad++, you must be very unhappy about Arduino's editing interface.

But, you can use an external editor, open Arduino IDE, click File -> Preferences, choose Use external editor:

Then you find you can't type in Arduino IDE, you can only use external editor now.

The following is my favorite editor: Vim, is it more beautiful than Arduino IDE?

以上是我使用 Vim 来编辑 Arduino 代码的截图，看起来比用 Arduino IDE 的编辑界面漂亮很多。
